# **NOTE**

- 1. The test results in this test report relate only to the devices specified in this report.
- 2. This report shall not be reproduced except in full without the written approval of East China Institute of Telecommunications.
- 3. For the test results, the uncertainty of measurement is not taken into account when judging the compliance with specification, and the results of measurement or the average value of measurement results are taken as the criterion of the compliance with specification directly.

# 3. Equipment Under Test (EUT) and Ancillary Equipment (AE)

### 3.1. About EUT

| Production               | Wireless data POS System                           |
|--------------------------|--|
| Model name               | T5921  |
| FCC ID                   | 2AH25T5921   |
| GSM Frequency Band       | GSM850/GSM900/GSM1800/GSM1900                      |
| UMTS Frequency Band      | Band I/II/IV/V                                     |
| CDMA Frequency Band      | BC0/BC1  |
| LTE Frequency Band       | Band 2/4/7/17/28                                   |
| Additional Communication | BT/BLE/2.4G WLAN 802.11 b/g/n20/n40/5G WLAN 802.11 |
| Function                 | a/n20/n40  |
| Extreme Temperature      | -30/+50°C  |
| Nominal Voltage          | 7.6V   |
| Extreme High Voltage     | 8.7V   |
| Extreme Low Voltage      | 7V   |

Note: Photographs of EUT are shown in ANNEX A of this test report.

# 3.2. Internal Identification of EUT used during the test

| EUT ID* | Model Name | SN or IMEI | HW       | SW Version     | Date of receipt |
|---------|------------|------------|----------|----------------|-----------------|
|         |            |            | Version  |                |                 |
| N01     | T5921      | 1          | QP1665_M | zqp1665_V002_1 | 2018-12-13      |
|         |            |            | B_PCB_V1 | 81121          |                 |
| N07     | T5921      | 1          | QP1665_M | zqp1665_V002_1 | 2018-12-13      |
|         |            |            | B_PCB_V1 | 81121          |                 |

<sup>\*</sup>EUT ID: is used to identify the test sample in the lab internally.

## 3.3. Internal Identification of AE used during the test

| AE ID* | Description | Туре | Manufacturer |
|--------|-------------|------|--------------|
| AE1    | RF cable    |      | AE1          |
|        |             |      |              |

<sup>\*</sup>AE ID: is used to identify the test sample in the lab internally.

## 4. Reference Documents

## 4.1. Documents supplied by applicant

All technical documents are supplied by the client or manufacturer, which is the basis of testing.

# 4.2. Reference Documents for testing

The following documents listed in this section are referred for testing.

| Reference   | Title                                  | Version  |
|-------------|--|----------|
| FCC Part 24 | PERSONAL COMMUNICATIONS SERVICES       | 2018/10/ |
|             |  | 01       |
| FCC Part 22 | PUBLIC MOBILE SERVICES                 | 2018/10/ |
|             |  | 01       |
| FCC Part 2  | FREQUENCY ALLOCATIONS AND RADIO TREATY | 2018/10/ |
|             | MATTERS; GENERAL RULES AND REGULATIONS | 01       |

# 5. Test Results

# 5.1. Summary of Test Results

| Measurement Items              | Sub-clause of<br>Part15C               | Sub-claus<br>e of IC | Verdict |
|--------------------------------|--|----------------------|---------|
| Output Power                   | 2.1046/22.913(a)/<br>24.232(c)         | /                    | Р       |
| Peak-to-Average Ratio          | 24.232(d)                              | /                    | Р       |
| 99%Occupied Bandwidth          | 2.1049(h)(i)/<br>22.917(b)             | /                    | Р       |
| -26dB Emission Bandwidth       | 22.917(b)/§24.238<br>(b)               | /                    | Р       |
| Band Edge at antenna terminals | 22.917(a)/24.238(<br>a)                | /                    | Р       |
| Frequency stability            | 2.1055/24.235                          | /                    | Р       |
| Conducted Spurious mission     | 2.1053/22.917(a)/<br>24.238(a)         | /                    | Р       |
| Emission Limit                 | 2.1051/22.917/24.<br>238/22.913/24.232 | /                    | Р       |

Note: please refer to Annex A in this test report for the detailed test results.

### The following terms are used in the above table.

| Р  | Pass, the EUT complies with the essential requirements in the standard.        |  |  |  |  |
|----|--|--|--|--|--|
| NP | Not Perform, the test was not performed by ECIT.                               |  |  |  |  |
| NA | Not Applicable, the test was not applicable.                                   |  |  |  |  |
| F  | Fail, the EUT does not comply with the essential requirements in the standard. |  |  |  |  |

### **Test Conditions**

| Tnom | Normal Temperature |  |
|------|--------------------|--|
| Tmin | Low Temperature    |  |
| Tmax | High Temperature   |  |
| Vnom | Normal Voltage     |  |
| Vmin | Low Voltage        |  |
| Vmax | High Voltage       |  |
| Hnom | Norm Humidity      |  |
| Anom | Norm Air Pressure  |  |

For this report, all the test case listed above are tested under Normal Temperature and Normal Voltage, and also under norm humidity, the specific conditions as following:

| Temperature  | Tnom | 25℃     |
|--------------|------|---------|
| Voltage      | Vnom | 7.6V    |
| Humidity     | Hnom | 48%     |
| Air Pressure | Anom | 1010hPa |

#### 5.2. Statements

The T5921, supporting GPRS/EDGE/WCDMA/CDMA/LTE/BT/BLE/WLAN/NFC, manufactured by Shanghai Sunmi Technology Co.,Ltd., is an initial product for testing.

ECIT only performed test cases which identified with P/NP/NA/F results in Annex A.

ECIT has verified that the compliance of the tested device specified in section 3 of this test report is successfully evaluated according to the procedure and test methods as defined in type certification requirement listed in section 4 of this test report.

# 7. Measurement Uncertainty

Measurement uncertainty for all the testing in this report are within the limit specified in ECIT documents . The detailed measurement uncertainty is defined in ECIT documents.

| Measurement Items                       | Range              | Confide<br>nce<br>Level | Calculated Uncertainty |
|---|--------------------|-------------------------|------------------------|
| Maximum Peak Output Power               | 30MHz-3600MHz      | 95%                     | $\pm$ 0.544dB          |
| EBW and VBW                             | 30MHz-3600MHz      | 95%                     | ±62.04Hz               |
| Transmitter Spurious Emission-Conducted | 30MHz-2GHz         | 95%                     | $\pm$ 0.90dB           |
| Transmitter Spurious Emission-Conducted | 2GHz-3.6GHz        | 95%                     | $\pm$ 0.88dB           |
| Transmitter Spurious Emission-Conducted | 3.6GHz-8GHz        | 95%                     | $\pm$ 0.96dB           |
| Transmitter Spurious Emission-Conducted | 8GHz-20GHz         | 95%                     | $\pm$ 0.94dB           |
| Transmitter Spurious Emission-Radiated  | 9KHz-30MHz         | 95%                     | $\pm 5.66$ dB          |
| Transmitter Spurious Emission-Radiated  | 30MHz-1000MHz      | 95%                     | $\pm 4.98$ dB          |
| Transmitter Spurious Emission-Radiated  | 1000MHz -18000MHz  | 95%                     | $\pm 5.06$ dB          |
| Transmitter Spurious Emission-Radiated  | 18000MHz -40000MHz | 95%                     | $\pm$ 5.20dB           |
| Frequency stability                     | 1MHz-16GHz         | 95%                     | $\pm$ 62.04Hz          |

# 8. Measurement Uncertainty

**Shielding Room1** (6.0 meters×3.0 meters×2.7 meters) did not exceed following limits along the conducted RF performance testing:

| Temperature              | Min. = 15 °C, Max. = 35 °C |
|--------------------------|----------------------------|
| Relative humidity        | Min. = 20 %, Max. = 75 %   |
| Shielding effectiveness  | > 100 dB                   |
| Ground system resistance | < 0.5 Ω                    |

Control room did not exceed following limits along the EMC testing:

| Temperature              | Min. = 15 °C, Max. = 35 °C |
|--------------------------|----------------------------|
| Relative humidity        | Min. =25 %, Max. = 75 %    |
| Shielding effectiveness  | > 100 dB                   |
| Electrical insulation    | > 10 kΩ                    |
| Ground system resistance | < 0.5 Ω                    |

Fully-anechoic chamber1 (6.9 meters×10.9 meters×5.4 meters) did not exceed following limits along the EMC testing:

| Temperature                  | Min. = 15 °C, Max. = 35 °C                 |
|------------------------------|--|
| Temperature                  | Willi. = 13 C, Wax. = 33 C                 |
| Relative humidity            | Min. = 25 %, Max. = 75 %                   |
| Shielding effectiveness      | > 100 dB                                   |
| Electrical insulation        | > 10 kΩ                                    |
| Ground system resistance     | < 0.5 Ω                                    |
| VSWR                         | Between 0 and 6 dB, from 1GHz to 18GHz     |
| Site Attenuation Deviation   | Between -4 and 4 dB,30MHz to 1GHz          |
| Uniformity of field strength | Between 0 and 6 dB, from 80MHz to 3000 MHz |

### ANNEX A. Detailed Test Results

#### ANNEX A.1. OUTPUT POWER

#### A.1.1. Summary

During the process of testing, the EUT was controlled Rhode & Schwarz Digital Radio.

Communication tester (CMU-200) to ensure max power transmission and proper modulation.

This result contains peak output power and EIRP measurements for the EUT. In all cases, output power is within the specified limits.

#### A.1.2. Conducted

#### A.1.2.1. Method of Measurements

Method of measurements please refer to CFR47 (FCC) part 2.1046 and part 22.913.

The EUT was set up for the max output power with pseudo random data modulation.

The power was measured with Rhode & Schwarz Spectrum Analyzer FSQ(peak).

These measurements were done at 3 frequencies, 1851.25 MHz, 1880.0MHz and 1908.75MHz for CDMA2000 PCS BC1band; 824.7MHz, 836.52MHz and 848.31MHz for CDMA2000 Cellular BC0 band. (bottom, middle and top of operational frequency range).

These measurements were done at 3 frequencies, 1851.25 MHz, 1880.0MHz and 1908.75MHz for 1xEV-DO BC1band; 824.7MHz, 836.52MHz and 848.31MHz for 1xEV-DO BC0 band. (bottom, middle and top of operational frequency range).

#### A.1.2.2 Test procedures:

- 1. The transmitter output port was connected to base station.
- 2. Set the EUT at maximum power through base station.
- 3. Select lowest, middle, and highest channels for each band and different modulation.
- 4. Measure the maximum burst average power for CDMA and maximum average power for other modulation signal.

#### A.1.2.3 Limit:

22.913(a) Mobile stations are limited to 7watts.

24.232(c) Mobile and portable stations are limited to 2 watts.

#### A.1.2.4 Test Procedure:

The transmitter output power was connected to calibrated attenuator, the other end of which was connected to signal analyzer. Transmitter output power was read off the power in dBm. The power outputs at the transmitter antenna port was determined by adding the value of attenuator to the signal analyzer reading.

#### A.1.2.5 CDMA2000 Cellular Test Condition:

| RBW  | VBW  | Sweep time | Span  |
|------|------|------------|-------|
| 1MHz | 3MHz | 300ms      | 10MHz |

**Conclusion: PASS** 

### ANNEX A.2. Peak-to-Average Power Ratio

Method of test measurements please refer to CFR47 (FCC) part 2.1046 and part 22.913.

#### A.2.1 PAPR Limit

The peak-to-average power ratio (PAPR) of the transmission may not exceed 13dB

### A.2.2 Test procedures

- 1. The EUT was connected to the spectrum analyzer and system simulator via a power divider.
- 2.
- 1) Select the spectrum analyzer CCDF function.
- 2) Set RBW ≥ signal's occupied bandwidth.
- 3) Set the number of counts to a value that stabilizes the measured CCDF cure;
- 4) Sweep time  $\geq$  1s.
- 3. Record the maximum PAPR level associated with a probability of 0.1%.

#### A.2.3 Test results:

**Conclusion: PASS** 

### ANNEX A.3. Occupied Bandwidth

Method of test please refer to CFR 47 (FCC) part 2.1049 and part 22 subpart .

#### A.3.1. Occupied Bandwidth

Similar to conducted emissions; occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequencies of CDMA2000 Cellular, CDMA2000 PCS, 1xEV-DO.

#### A.3.2 Test Procedure:

- 1. The EUT output RF connector was connected with a short cable to the signal analyzer.
- 2. RBW was set to about 1% of emission BW, VBW >= 3 times RBW,.
- 99% bandwidth were measured, the occupied bandwidth is delta frequency between the two points where the display line intersects the signal trace.

#### A.3.3 Test result:

| CDMA2000 Cellular BC0 |                 |                                |
|-----------------------|-----------------|--------------------------------|
| Test channel          | Frequency (MHz) | 99% Occupied<br>Bandwidth(MHz) |
| Mid 777               | 848.31          | 1.279                          |
| Low 384               | 836.52          | 1.284                          |
| High 1013             | 824.7           | 1.284                          |

### ANNEX A.4. -26dB Emission Bandwidth

Method of test please refer to CFR 47 (FCC) part 2.1049 and part 22 subpart.

#### A.4.1. -26dB Emission Bandwidth

Similar to conducted emissions; occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequencies of CDMA2000 Cellular, CDMA2000 PCS, 1xEV-DO.

#### A.4.2 Test Procedure:

- 1. The EUT output RF connector was connected with a short cable to the signal analyzer.
- 2. RBW was set to about 1% of emission BW, VBW >= 3 times RBW,.
- 3. 26dB bandwidth were measured, the occupied bandwidth is delta frequency between the two points where the display line intersects the signal trace.

#### A.4.3 Measurement methods:

For CDMA: signal analyzer setting as: RBW=20KHz;VBW=200KHz;Span=3MHz.

#### A.4.4 Test results:

| CDMA2000 Cellular BC0 |                 |  |

# ANNEX A.5. Band Edge at antenna terminals

Method of test measurements please refer to CFR 47 (FCC) part 2.1051 and part 22.917.

#### A.5.1 Limit:

The magnitude of each spurious and harmonic emission that can be detected when the equipment is operated under the conditions specification in the instruction manual and/or alignment procedure, shall not be less than 43+10log (Mean power in watts) dBc below the mean power output outside a license's frequency block(-13dBm).

#### A.5.2 Test procedure:

- 1. The RF output of the transceiver was connected to a signal analyzer through appropriate attenuation.
- In the 1MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed.
- 3. The RF fundamental frequency should be excluded against the limit line in the operating frequency band
- 4. The limit line is derived from 43+10log(P) Db below the transmitter power P(Watts)
  - =P(W)-[43+10log(P)](Db)
  - $=[30+10\log(P)](dBm)-[43+10\log(P)](Db)$
  - =-13dBm

#### ANNEX A.6. FREQUENCY STABILITY

Method of test measurements please refer to CFR47 (FCC) part 2.1055 and part 22.355.

#### A.6.1.Method of Measurement and test procedures

In order to measure the carrier frequency under the condition of AFC lock, it is necessary to make measurements with the EUT in a "call mode". This is accomplished with the use of R&S CMU200 DIGITAL RADIO COMMUNICATION TESTER.

- 1. Measure the carrier frequency at room temperature.
- 2. Subject the EUT to overnight soak at -30°C.
- 3. With the EUT, powered via nominal voltage, connected to the CMU200 and in a simulated call on mid channel of GSM850, PCS1900, WCDMA BANDII and WCDMA BANDV, measure the carrier frequency. These measurements should be made within 2 minutes of Powering up the EUT, to prevent significant self-warming.
- 4. Repeat the above measurements at  $10^{\circ}$ C increments from  $-30^{\circ}$ C to  $+50^{\circ}$ C. Allow at least 1 1/2 hours at each temperature, unpowered, before making measurements.
- 5. Re-measure carrier frequency at room temperature with nominal voltage. Vary supply voltage from minimum voltage to maximum voltage, in 0.1Volt increments re-measuring carrier frequency at each voltage. Pause at nominal voltage for 1 1/2 hours unpowered, to allow any self-heating to stabilize, before continuing.
- 6. Subject the EUT to overnight soak at  $+50^{\circ}$ C.
- 7. With the EUT, powered via nominal voltage, connected to the CMU200 and in a simulated call on the centre channel, measure the carrier frequency. These measurements should be made within 2 minutes of Powering up the EUT, to prevent significant self-warming.
- 8. Repeat the above measurements at 10 C increments from  $+50^{\circ}$ C to  $-30^{\circ}$ C. Allow at least 1.5 hours at each temperature, unpowered, before making measurements.
- 9. At all temperature levels hold the temperature to +/- 0.5 °C during the measurement procedure.

#### A.6.2. Measurement Limit

#### A.6.2.1. For Hand carried battery powered equipment

According to the JTC standard the GSM frequency stability of the carrier shall be accurate to within 0.1ppm of the received frequency from the base station. And the WCDMA is 2.5ppm. This accuracy is sufficient to meet Sec.24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. As this transceiver is considered "Hand carried, battery powered equipment" Section 2.1055(d)(2) applies. This requires that the lower voltage for frequency stability testing be specified by the manufacturer. This transceiver is specified to operate with an input voltage of between 7VDC and 8.7VDC, with a nominal voltage of 7.6VDC. Operation above or below these voltage limits is prohibited by transceiver software in order to prevent improper operation as well as to protect components from overstress. These voltages was varied from 85% to 115%.

#### A.6.2.2. For equipment powered by primary supply voltage

According to the JTC standard the CDMA frequency stability of the carrier shall be accurate to within 0.1ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec.24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission

East China Institute of Telecommunications TEL: +86 21 63843300FAX: +86 21 63843301 Page Number : 50 of 105 Report Issued Date: Jan. 23, 2019

Page Number

: 51 of 105

Report Issued Date: Jan. 23, 2019

stays within the authorized frequency block. For this EUT section 2.1055(d)(1) applies. This requires varying primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

#### ANNEX A.7. CONDUCTED SPURIOUS EMISSION

#### A.7.1. CDMA Measurement Method and test procedures

The following steps outline the procedure used to measure the conducted emissions from the EUT.

- 1. Determine frequency range for measurements: From CFR 2.1057 the spectrum should be investigated from the lowest radio frequency generated in the equipment up to at least the 10th harmonic of the carrier frequency. For the equipment of BC1 band, this equates to a frequency range of 9 kHz to 12.75 GHz, data taken from 9 kHz to 12.75 GHz. For BC0 band, data taken from 9 kHz to 12.75 GHz.
- 2. The sweep time is set automatically by instrument itself. That should be the optimal sweep time for the span and the RBW. If the sweep time is too short, that is sweep is too fast, the sweep result is not accurate; If the sweep time is too long, that is sweep is too low, some frequency components may be lost. The instrument will give a optimal sweep time according the selected span and RBW.
- 3. The procedure to get the conducted spurious emission is as follows: The trace mode is set to MaxHold to get the highest signal at each frequency; Wait 25 seconds;Get the result.
- 4. Determine EUT transmit frequencies: below outlines the band edge frequencies pertinent to conducted emissions testing.

#### **CDMA2000 Cellular Transmitter**

| 600     | 1880.0         |  |

#### A.7.1.1. Measurement Limit

Part 24.238 and Part 22.917 specify that the power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.

The specification that emissions shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB, translates in the relevant power range (1 to 0.001 W) to -13 dBm. At 1 W the specified minimum attenuation becomes 43 dB and relative to a 30 dBm (1 W) carrier becomes a limit of -13 dBm. At 0.001 W (0 dBm) the minimum attenuation is 13 dB, which again yields a limit of -13 dBm. In this way a translation of the specification from relative to absolute terms is carried out.

#### A.7.1.2. Measurement result

Spurious emission limit -13dBm.

Note: peak above the limit line is the carrier frequency.

#### A.8.1.1. CDMA/1xEV-DO ERP

#### A.8.1.1.1. Description

This is the test for the maximum radiated power from the EUT.

Rule Part 24.232(c) specifies, "Mobile/portable stations are limited to 2 watts e.i.r.p. Peak power"and 24.232(c) specifies that "Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage."Rule Part 22.913(a) specifies "The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts."

### A.8.1.1.2. Method of Measurement

The measurements procedures in TIA-603E-2016 are used.

1. EUT was placed on a 1.5 meter high non-conductive stand at a 3 meter test distance from thereceive antenna. A receiving antenna was placed on the antenna mast 3 meters from the EUTfor emission measurements. The height of receiving antenna is 1.5m. The test setup refers to figure below. Detected emissions were maximized at each frequency by rotating the EUTthrough 360° and adjusting the receiving antenna polarization. The radiated emissionmeasurements of all transmit frequencies in three channels (High, Middle, Low) were measured with peak detector.

- 2. The EUT is then put into continuously transmitting mode at its maximum power level duringthe test. And the maximum value of the receiver should be recorded as (Pr).
- 3. The EUT shall be replaced by a substitution antenna. The test setup refers to figure below.

In the chamber, an substitution antenna for the frequency band of interest is placed at thereference point of the chamber. An RF Signal source for the frequency band of interest isconnected to the substitution antenna with a cable that has been constructed to not interferewith the radiation pattern of the antenna. A power (PMea) is applied to the input of thesubstitution antenna, and adjust the level of the signal generator output until the value of thereceiver reach the previously recorded (Pr). The power of signal source (PMea) is recorded. Thetest should be performed by rotating the test item and adjusting the receiving antennapolarization.

4. A amplifier should be connected to the Signal Source output port. And the cable should beconnect between the Amplifier and the Substitution Antenna.

The cable loss (Pcl) ,the Substitution Antenna Gain (Ga) and the Amplifier Gain (PAg) should be recorded after test.

The measurement results are obtained as described below:

Power(EIRP)=PMea+ PAg- PcI+ Ga

- 5. This value is EIRP since the measurement is calibrated using an antenna of known gain (2.15dBi) and known input power.
- 6. ERP can be calculated from EIRP by subtracting the gain of the dipole, ERP = EIRP -2.15dBi.

# A.8.2 EMISSION LIMIT (§2.1051/§22.917§24.238)

Page Number : 96 of 105 Report Issued Date: Jan. 23, 2019

#### A.8.2.1 CDMA/1xEV-DO Measurement Method

The measurement procedures in TIA-603E-2016are used.

The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment, which is the transmitted carrier that can be as high as 1910 MHz. The resolution bandwidth is set as outlined in Part 24.238 and Part 22.917. The spectrum is scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of PCS1900 and GSM850.

#### A.8.2.2 The procedure of radiated spurious emissions is as follows:

1. EUT was placed on a 1.5 meter high non-conductive stand at a 3 meter test distance from the receive antenna. A receiving antenna was placed on the antenna mast 3 meters from the EUT for emission measurements. The height of receiving antenna is 1.5m. The test setup refers to figure below. Detected emissions were maximized at each frequency by rotating the EUT through 360° and adjusting the receiving antenna polarization. The radiated emission measurements of all non-harmonic and harmonics of the transmit frequency through the 10<sup>th</sup>harmonic were measured with peak detector.

- 2. The EUT is then put into continuously transmitting mode at its maximum power level during the test. And the maximum value of the receiver should be recorded as (Pr).
- 3. The EUT shall be replaced by a substitution antenna. The test setup refers to figure below.

In the chamber, an substitution antenna for the frequency band of interest is placed at the reference point of the chamber. An RF Signal source for the frequency band of interest is connected to the substitution antenna with a cable that has been constructed to not interfere with the radiation pattern of the antenna. A power (PMea) is applied to the input of the substitution antenna, and adjust the level of the signal generator output until the value of the receiver reach the previously recorded (Pr). The power of signal source (PMea) is recorded. The test should be performed by rotating the test item and adjusting the receiving antenna

polarization.

4. The Path loss (Ppl) between the Signal Source with the Substitution Antenna and the Substitution Antenna Gain (Ga) should be recorded after test.

A amplifier should be connected in for the test.

The Path loss (Ppl) is the summation of the cable loss.

The measurement results are obtained as described below:

Power(EIRP)=PMea- Ppl+ Ga

- 5. This value is EIRP since the measurement is calibrated using an antenna of known gain (2.15 dBi) and known input power.
- 6. ERP can be calculated from EIRP by subtracting the gain of the dipole, ERP = EIRP 2.15dBi

#### A.8.2.3 Measurement Limit

Part 24.238 and Part 22.917 specify that the power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.

The specification that emissions shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB, translates in the relevant power range (1 to 0.001 W) to -13 dBm. At 1 W the specified minimum attenuation becomes 43 dB and relative to a 30 dBm (1 W) carrier becomes a limit of -13 dBm. At 0.001 W (0 dBm) the minimum attenuation is 13 dB, which again yields a limit of -13 dBm. In this way a translation of the specification from relative to absolute terms is carried out.

#### A.8.2.4 Measurement Results

Radiated emissions measurements were made only at the upper, middle, and lower carrier frequencies of the PCS1900 band (1850.2 MHz, 1880 MHz and 1909.8 MHz) and GSM850 band (824.2MHz, 836.6MHz, 848.8MHz) . It was decided that measurements at these three carrier frequencies would be sufficient to demonstrate compliance with emissions limits because it was seen that all the significant spurs occur well outside the band and no radiation was seen from a carrier in one block of the PCS1900 ,GSM850 into any of the other blocks. The equipment must still, however, meet emissions requirements with the carrier at all frequencies over which it is capable of operating and it is the manufacturer's responsibility to verify this.
